

# **How To Design & Build Efficient Cold Store With minimum Heat Gain and minimum Moisture penetration?**

**By**

**Ramesh Paranjpey**

**Fellow Life Member ASHRAE**

**27-12-2022**

**PART-1**  
**GENERAL CONSIDERATIONS**

# DOCKS-OLD METHOD

# DOCKING AREA-LATEST METHOD

# CONVENTIONAL CONSTRUCTION - RCC

# STEEL STRUCTURE-OLD DESIGN

# MODERN PRE ENGINEERED BUILDING STRUCTURES-LATEST CONSTRUCTION METHOD

# BOX OUT DESIGN

# BOX IN DESIGN

# PRE ENGINEERED STRUCTURE WITH PUF PANELS

# EXTERIOR BUILDING VIEW

- Tilt-up Construction at the dock Level
- Insulated Panels

# SIZE AND SHAPE MATTERS

**Dimension 1m\*1m\*1m**

**Surface Area : 6 m<sup>2</sup>**

**Floor Area 1 m<sup>2</sup>**

**Aspect Ratio 6**

**Dimension 0.5m\*2m\*1m**

**Surface Area :7.0 m<sup>2</sup>**

**Floor Area 1 m<sup>2</sup>**

**Aspect Ratio 7**

**Aspect Ratio = Surface Area / Floor Area**

**CUBICLE SHAPE PREFERRED**

# THE BUILDING LAYOUT PLANNING

1. Ceiling With Ventilated Attic Space
2. Planning Layout With Ante Room To Ensure Outside Air And Cold Room Has In-between Barrier To Reduce Both Heat & Moisture Gain
3. Office Location Near Goods Entrance
4. Room For Expansion Of Cold Storage Area And Space For Additional Rooms
5. Separate Entrances For Cold Rooms, Machine Room, Offices?
6. Fire Protection Devices Installed At The Right Places
7. Docks Tilt Up Design To Ensure Trucks/Trailers-no Air Leakage
8. Site – Parking Area Provision
9. Space For Vehicle Turn Around Movement
10. Waste Material Disposal Area
11. Number, Type And Size Of Doors,

# **BUILDING FEATURES**

1. Minimize columns
2. High ceilings
3. Avoid Condensation
4. Provide Racking arrangement
5. Equipment/machinery-separate room
6. Minimize painting-use pre coated panels
7. Minimize flat edges and corners to avoid turbulence inside the cold room
8. Trees/Shading on the East and West side walls

# HEAT GAIN FACTORS

1. **Sensible Heat Gain**- transmission heat gain- Through walls due to temperature difference between ambient temperature and cold room inside temperature- $\Delta T$

This load is termed as sensible heat gain

2. **Latent Heat gain due to moisture**- $\Delta P$  –vapour pressure difference between ambient vapour pressure and the inside cold room vapour pressure

Since temperature is a easily measurable parameter -load calculations are easy, with PUF/PIR panels moisture proof panels- no need to consider latent load

# MOISTURE-X

Moisture is the greatest enemy

Temperature can be measured

Moisture in the air is invisible

## **PROBLEMS –MOISTURE PENETRATION**

Ice formation, fogging, condensation on walls, ceiling, ice around the doors, frequent defrosting

### **REASONS**

1. Leakages- through doors, cracks, pipe/cable openings
2. No proper vapour barriers or seals on walls, roof, flooring
3. Use of incorrect insulation material
5. Doors remaining open too long during loading
6. No ante room provision-Air lock
7. No air curtains on the cold room doors

## LATENT HEAT V/S SENSIBLE HEAT

- To Cool one kg of dry air requires **1.006** kJ/kg<sub>da</sub>·K energy (0.24 Btu/lb)
- To condense one kg of Vapor requires **2500.77** kJ/kg<sub>da</sub>·k energy (1076Btu/lb.)
- To condense one lb. of air requires **970**Btu/lb. whereas to cool one lb. air one requires only **0.24**Btu/lb. ( $970 \div 0.24 = \underline{4041}$  **times more energy required to condense water** )

# RELATIVE HUMIDITY IS A MISNOMER

Always measure absolute Humidity or  $\text{g/kg}_{\text{da}}$   
of air

- Relative Humidity indicates only the ability of air to absorb additional moisture
- High Relative Humidity does not mean high moisture content

# SPECIFIC HUMIDITY OR MOISTURE CONTENT G/KG- MORE IMPORTANT THAN R.H.

Sr. No.	Degree C	R.H. %	Moisture content g/Kg.da
1	5	90	0.6
2	15	90	1.2(Twice the amount of moisture compared to sr.no.1)

Sr.No.	Temperature	Moisture content- g/kgda	R.H.%
1	5-degree C	0.6	90
2	30-degree C	0.6	20

**HIGHER R. H. DOES NOT MEAN HIGHER MOISTURE CONTENT**

# PROPERTIES OF AIR

Temperature °C	Relative Humidity %	Absolute Humidity- g/kg of dry air	Partial pressure of water vapour-Pa
40	25	11.59	13.86
5	85	4.6	5.56
-20	95	0.6	0.73
-40	95	0.075	0.019

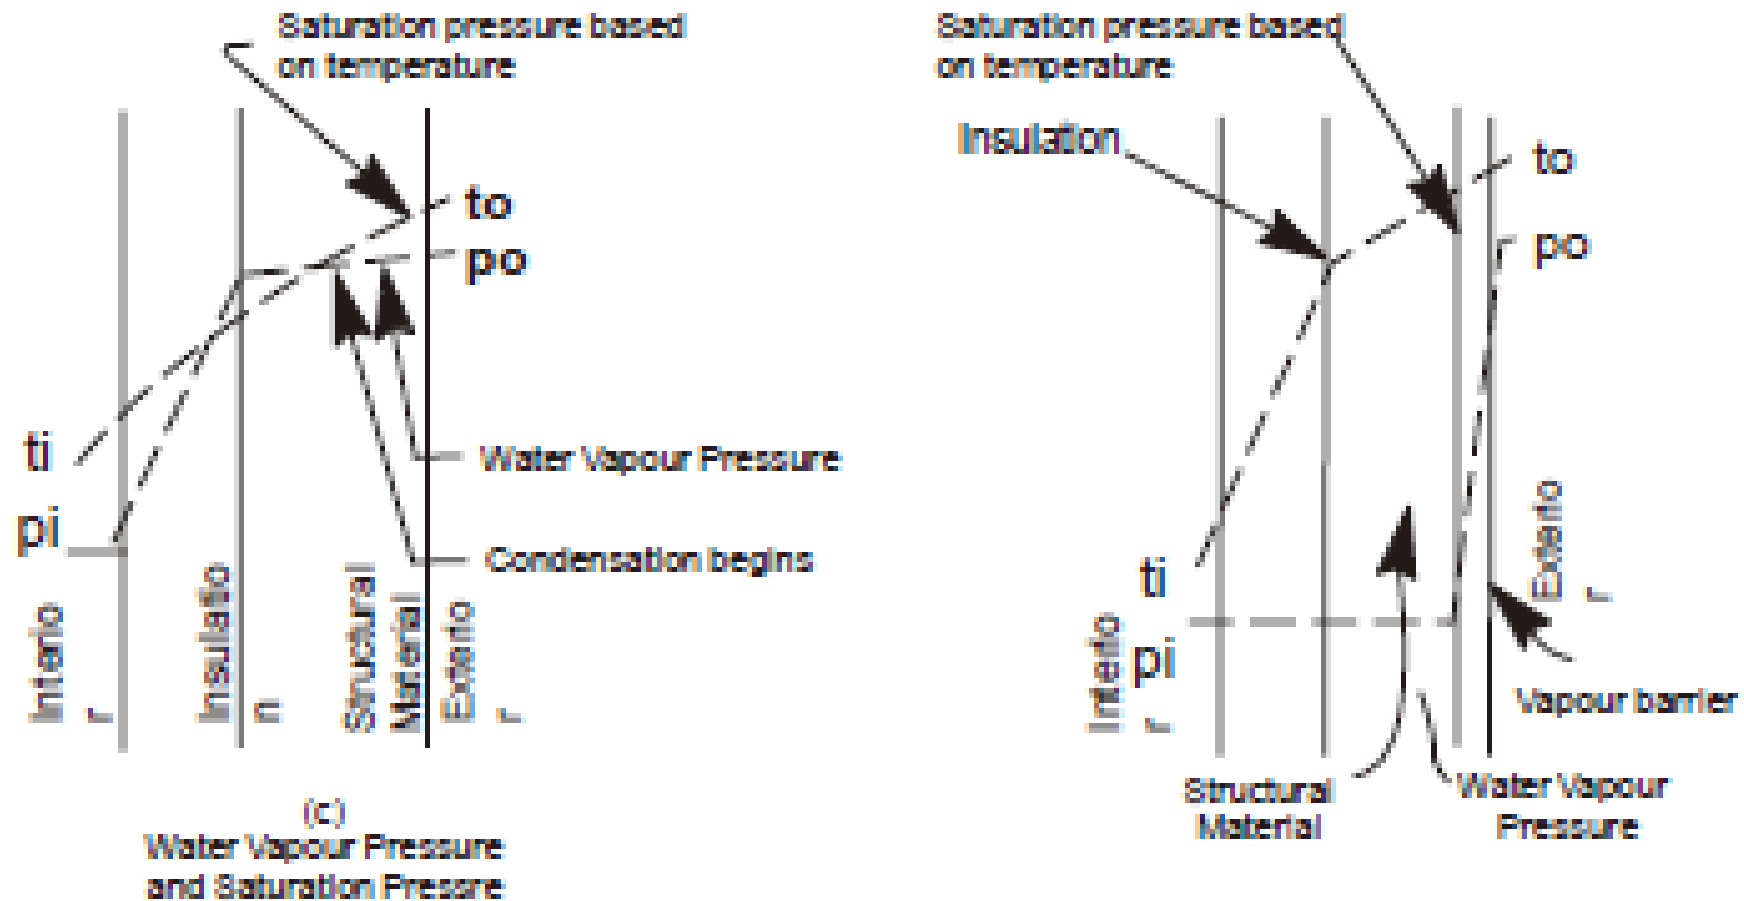

## Higher R.H. does not mean more moisture content-

1. 5°C & 85% R.H. has less moisture content 4.6 g/kg<sub>da</sub> as against
2. 40°C & 25%. R.H.-11.59g/kg<sub>da</sub> indicating that higher R.H. air has lower moisture content than air having lower R.H.
2. R.H is not correct indicator, find out g/kg for inside and outside conditions-or vapour pressure difference which is a driving force for moisture
- 3.The vapour pressure difference(13.86-5.56) is the driving force for moisture to enter the cold storage .
4. **Lower the temperature of cold room more is (vapour pressure difference) the driving force for moisture penetration**

# **IMPORTANCE OF VAPOUR BARRIER**

## VAPOUR PRESSURE /TEMPERATURE DIFFERENCES

**Providing Vapour Barrier on Warm side drastically reduces vapour pressure below condensation temperature/pressure**

**Construct a vapour Tight moisture  
proof cold storage and not  
an ice factory-provide proper vapour  
barriers in Flooring,Walls and Roof**

**FOG FORMATION**

**ICE ON FLOOR & FOG**

**MOISTURE PENETRATION THROUGH DOORS**

**CEILING DRIPPING**

# DEFROST LOADS-LATENT LOADS-BTU/0.7LB FROM COIL

		kWh
1	To produce Frost	0.21 kWh
2	To Defrost Frost	0.09 kWh
3	To remove Defrost Heat	0.16 kWh
4	Total power	0.46 kWh
6	Power required to remove 1 lb of ice	$0.46/0.7=$ 0.66 kWh
7	Power required to remove 1 kg of ice	1.45kWh

# TYPES OF VAPOUR RETARDERS

## Plastic coatings or thin fluids

- Examples of materials of this category are asphalt, bituminous emulsions and polymer resins. These types of vapour retarders are applied on the exterior surface of insulation, usually before the insulation is installed.

### 1. Sealing sheets

The examples in this category include asphalt paper, plastic sheets, and metal films.

Metal films like aluminum foil is inexpensive and excellent vapour barrier but is difficult to install and it is impossible to make a fool proof seal without considerable punctures occurring. Also, if applied to walls directly there is possibility of corrosion as well.

# VAPOUR BARRIER—POLYETHYLENE SHEETS

**Polyethylene** installation becomes comparatively easier due to reduced number of joints and overlapping and bonding wherever required.

Also, polyethylene is quite stretchable before fracture occurs unlike metal foil. This characteristic is highly desirable in a cold storage vapour barrier in order to absorb building movement without rupture.

It should be also noted that **two thin** layers of film are not as good as **one thick** layer since there are twice as many chances of failure of the vapour barrier and it would require double the labour, seals, and joint overlaps.

## Typical Permeance Values for selected Material (IARW 1995)

IARW-International Association of Refrigerated Warehouses

Material	Perm value
Concrete block 8" thick	2.4
Exterior grade plywood ¼" thick	0.7
Hot melt asphalt 2 oz/sq.ft.	0.5
Reinforced concrete slab 8" thick	0.4
Polyethylene film 0.20 mm thick	0.04
Polyethylene film 0.25 mm	0.03
Metal foil –aluminum	0.0

**Recommended-Polyethylene film 0.25 mm**

# TRENDS IN THERMAL INSULATION PRACTICES

## ■ Old Units

- Rice husk used as Thermal Insulation
- Cheap but necessitated large thickness
- Lot of maintenance problems
- Walls and Ceiling finished with AC sheets
- Many units had cork as insulation
- Lot of moisture penetration

## ■ Last Three decades

- Expanded Polystyrene, Fiber glass on walls and ceilings with sand and cement plaster or Sheet metal cladding using Aluminum sheet or Pre coated G.S. sheet. Floor with EPS.

## ■ Latest or current practices

- Prefab Insulated Panel Structure (also called Sandwich Panel)
  - EPS Panels with EPS bonded to sheet metal skins using special glue
  - PUF/PIR Panels using Polyurethane/Polyisocyanurate as insulation material foamed between two metal skins

# INSULATED PANELS

## Applications

- Application right from small walk-ins to very large Cold Stores
- Used also for processing plants, prefabricated houses, ware houses etc.
- Also for doors for cold stores –light and simple construction

## Highlights

- Greater flexibility and faster construction
- Better isolation and better thermal insulation & vapour barrier
- Brick Walls eliminated and therefore C.S. volume increases on a given floor area
- Modular construction feasible and offers advantage of addition / expansion as per requirement
- Now being regularly used in most of the cold chain projects.

## PANEL CONSTRUCTION

**A pre-coated galvanised iron (PCGI) laminated panel has the following layers:**

- 1. Zinc coat and passive layer**
- 2. Primer coating**
- 3. First topcoat: silicon mould polyester**
- 4. Second topcoat: silicon mould polyester**
- 5. Peel off guard film**
- 6. Zinc coating**
- 7. Corrosion inhibitive primer**
- 8. Back coat**

# INSULATION-RECOMMENDED

- **Floor Insulation**
  - **Extruded polystyrene(EPS)**
- **Wall panels**
  - **Polyurethane(PUF)**
- **Roof Insulation**
  - **Polyisocyanurate(PIR)**

# MORE INSULATION MEANS LESS ENERGY AND MORE SAVINGS

	$Q = U \times A \times TD = U \times 2(21 \times 16 + 21 \times 13.7 + 16 \times 13.7) \times (45 - 3)$	
80mm	$U = 0.023 / 0.080 = 0.2875$	Q = 20.356 kW
100 mm	$U = 0.023 / 0.1 = 0.23$	Q = 16.284 kW
120mm	$U = 0.023 / 0.12 = 0.1976$	Q = 13.57 kW
Savings	120mm instead 80 mm	20.356 - 13.57 = 6.786 kW/Room
Savings -4 Rooms-NHB	6.786 x 4 = 27.1 kW or 7.71 TR @ 1.1kW/TR = 8.481 kW	
	<b>8.481 kW x 8Rs/kW x 20 hrs/day x 300 days = Rs. 4,07,088</b>	

**K' Values for Various Material – (Btu/hr/sq.ft/Deg F /in OR W/m.k)**

**Polyisocyanurate Cellular Foam (R-141b expanded) Slabs – 0.16 / 0.027**

**Polyurethane Board Panels (R11-expanded) – 0.18 / 0.023 to 0.026**

**Polystyrene Extruded (R141b) – 0.24 / 0.035**

**Fiberglass – 0.24 / 0.035**

**Polystyrene Expanded (R141b) – 0.26 / 0.037**

WALLS, CEILING & FLOORING  
SO THAT IT BECOMES MOISTURE PROOF BUILDING  
& WITH MINIMUM HEAT GAIN**

# **WALLS CONSTRUCTION**

# 'C' or 'Z' Purlins For Wall to PEB Structure

- **Z Purlins are extremely strong and can support heavy structures although, C purlins have relatively less strength.** Therefore, in buildings with a bigger roofing or loading capacity, Z purlins would be a better choice. They are commonly used in agricultural and industrial buildings.

# FIXING PANEL TO PEB STRUCTURE WITH "Z" SECTION

**ALLOW PANEL TO MOVE DURING COOLING  
AND AT AMBIENT TEMPERATURE**

## WALL TO FLOOR JOINT

1. Wall Panel
2. Concrete protection wall
3. Concrete Floor
4. Two staggered layers of Floor insulation
5. Vapour barrier 0.3 mm Polyethylene film
6. Floor heating cable to avoid cracking
7. Spray Foam Sealing
8. Panel support Floor angle

3. Galvanized metal threaded rod
- 4. A.95 G. Steel Nut 40 x 40 x 12 mm**
5. Self tapping screws

**Note**

There are holes for the screws every 30 cm.  
on both sides

**OMEGA profile** for ceiling suspension solutions.  
Made from GFK / Polyester ensuring **no condensation !**

## SCREW FOR FASTENING ,CELINGS,DOOR FRAMSES,AND INSULATED PANELS-RESISTANCE-350Kg.Sizes M8.M10,M12

The screw prevent any formation  
of condensation

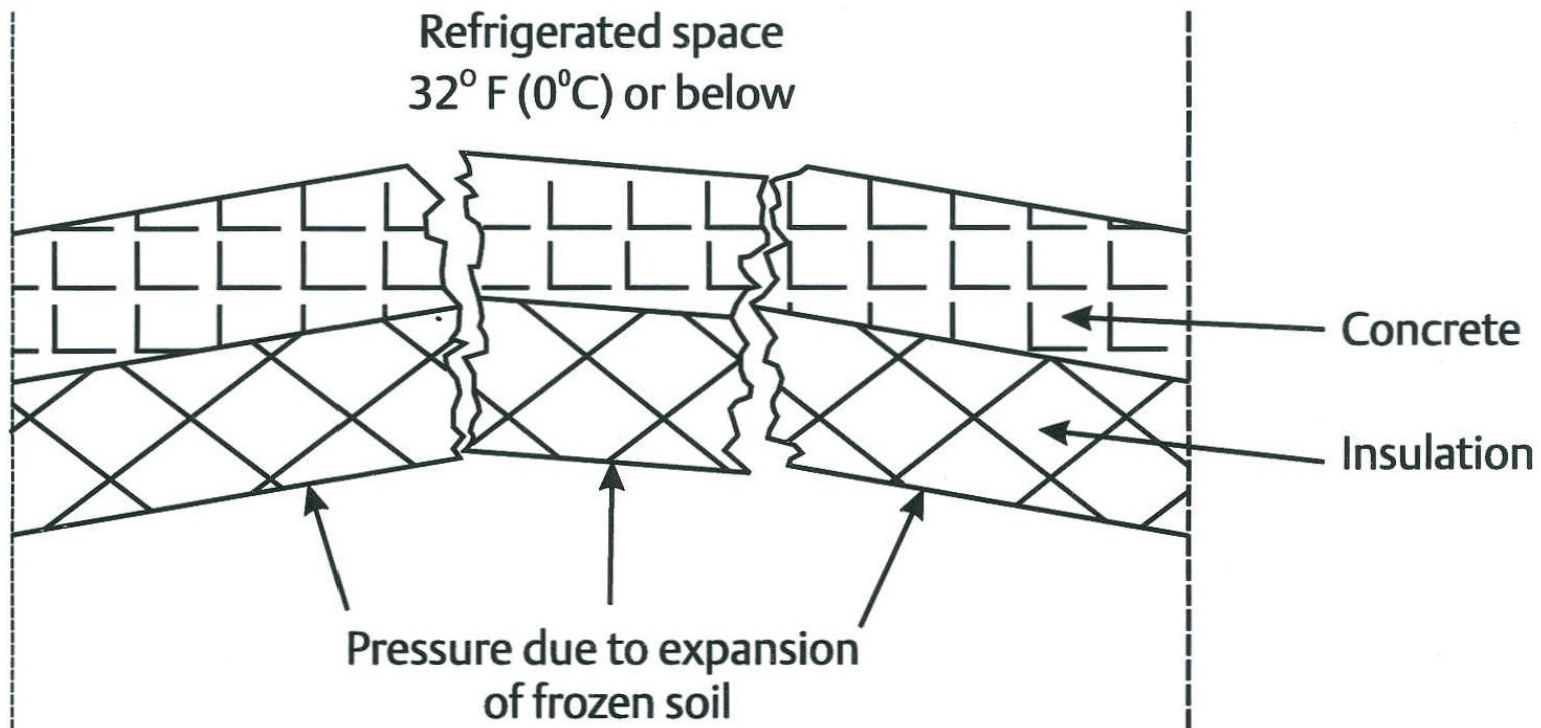

- Galvanized steel treaded rod can be used

# **FLOOR CONSTRUCTION**

# IMPROPER PROPER FLOOR CONSTRUCTION & ITS VAPOUR CEILING AS WELL AS ITS INSULATION

## Frost heaving and its prevention

# FLOOR CONSTRUCTION

- Floors
  - Type of finish
  - Slope (  $1/8$  in. –  $1/4$  in. )
  - Drains  $1/400$  s.f.
- Floor insulation
- Vapor barrier

# FLOOR CONSTRUCTION

## Most Common Approach -

1. Under Floor Heat System –
2. Concrete Sub Slab
3. 10 mill Poly Vapor Barrier –
4. 2 Layers of Extruded Polystyrene(5”-6”-7”) –
5. 6 mill Poly Slip Sheet –
6. Concrete Finish Floor(5”-8”)

# FLOOR WARMING

Any moisture in the sub soil freezes and causes floor frost heaving.

- There are methods to avoid these such as
  1. under floor tubes vented to atmospheric air
  2. Artificial heating by air circulated through under floor ducts
  3. Glycol circulated through plastic pipes
  4. Electric heating cables

1. Underfloor Heating System –
2. Concrete Sub Slab
3. 10 mil thick Poly Vapor Barrier –
4. 2 Layers of Extruded Polystyrene (5"-6"-7") –
5. 6 mill Poly Slip Sheet –
6. Concrete Finish Floor (5"-8")
7. Slope (1/8 in. – ¼ in.)
8. Drains 1/400 square feet

## **Air Vent Pipes- Frost heave prevention using underfloor ventilation (100 to 150mm dia. PVC pipes)**

According with some paper you should estimate between 2-3btu/ft<sup>2</sup> h the heat entering to the cold room through floor .

1. The air pipe should be PVC reinforced.
2. They should be installed between 1.2 to 1.6 m wide
3. The pipe should be 4" ,6" or 8" diameter according the length
4. It will be better located the pipe in the shorter distance
5. the pipes should be pitch 0,5 to 1% down
6. Each pipe should be independent .
7. The inlet should be protect against rain water and animals getting in.
8. The outlets should drain freely and protect it against animals

USE 100MM DIA PVC SCH80 with PIPES AND DRILL 3 MM HOLES AT A FREQUENCY OF 1.5M OR SO

## The general construction of flooring should be as under

1. first layer of sand
  2. Second layer of boulders, stones, rubble in which air vent pipes are embedded
  3. Third layer of plain cement concrete
  4. Fourth layer of vapour barrier of 10mm thick plastic sheets in two-layer overlap of minimum 2ft.
  5. 5<sup>th</sup> layer of 150mm trimix concrete dewatering type
- The air vent pipes could be 4" diameter PVC placed at 1 to 1,5 m apart over the entire width of flooring

THE CROSS-SECTION IS AS BELOW

THIS IS THE DETAILING OF THE ACTUAL FLOOR VENTILATION PIPE >>

# Air Vent Pipe Outlets

# Air Vent Pipe Outlets

## Vapour sealing & Glycol circulation system for Floor warming

**GLYCOL  
FLOOR  
WARMING  
SYSTEM**

1000 ft maximum length  
No joints permitted under floor

## ELECTRIC UNDERFLOOR WARMING SYSTEM

# Electrical cable warming under the floor

**SLIDING DOORS WITH ELECTRONIC SENSORS TO ENSURE THE DOOR OPENING TIME IS KEPT MINIMUM, HELPS IN SAVING ENERGY TO LARGE EXTENT**

## **PVC DOOR CURTAINS**

PVC 2mm thick, strip curtains are often used in cold storages. They are preferred to prevent the cold air escaping from the room when the door is opened. Because the most heat loss is experienced when the doors remain open. In addition to cold storage, PVC curtains are also preferred for the outside doors of factory and hangars.

## High Speed Doors - Prime Mesh

- CE European Certification. Built in conformity with EN 13241-1.
- Maximum light and insect protection screen.
- Full Mesh-M & Mesh-D curtain for ventilation, natural light while ensuring pest & bird free environment.
- Smooth and silent operation with opening speed upto 2.0 m/s and closing speed 0.5 m/s.
- Control panel & drive designed for intensive continuous operation.

# AIR CURTAINS

## SITE AND MEASURING PARAMETERS

OBJECT PARAMETER	LOCATION	DISTANCE	CONDITIONED PREMISE TEMP.	OUTSIDE AMBIENT TEMP.	EMISSIVITY
Value	Outdoor	05 FT	-21 C	23 C	0.95

## TEMPERATURE MEASUREMENTS

LABEL	RATED VALUE (°C)	TEMP. DECREASED BY (AS PER MIN) (°C)	OUTLINED AREA TEMP.		
			MIN. (°C)	AVG. (°C)	MAX. (°C)
U1	23	9.7	13.3	17.1	21.8

### **Recommended Action:**

Temperature at highlighted area in the real image is 9 C less than the ambient outside temperature. A panel joint at bottom has not been done properly. By injecting silicon sealant at mentioned area will maintained the temperature.

### TEMPERATURE MEASUREMENTS

LABEL	RATED VALUE (°C)	TEMP. INCREASED BY (°C)	OUTLINED AREA TEMP.		
			MIN. (°C)	AVG. (°C)	MAX. (°C)
U1	0	10	2.2	5.8	10.0

### TEMPERATURE MEASUREMENTS

LABEL	RATED VALUE (°C)	TEMP. INCREASED BY (°C)	OUTLINED AREA TEMP.		
			MIN. (°C)	AVG. (°C)	MAX. (°C)
U1	5	7.9	8.8	11.4	12.9

### TEMPERATURE MEASUREMENTS

LABEL	RATED VALUE (°C)	TEMP. INCREASED BY (°C)	OUTLINED AREA TEMP.		
			MIN. (°C)	AVG. (°C)	MAX. (°C)
U1	0	21.4	7.2	15.6	21.4

**Door Protectors**

## **PRESSURE EQUALIZATION VENT FLAPS**

# PRESSURE EQUALIZING VALVES

When air is cooled, its density increases and internal pressure reduces, if no equalizing valves are provided, the panels distort or collapse.
